

Designing for Dementia

VR-EP is Tarkett's brand new evidence-based 'Dementia Filter', which has been heralded as "cutting edge immersive software designed to help improve the lives of people living with Dementia."

Through the use of Virtual Reality and an Oculus headset, users can fully immerse themselves within a 3D care home environment and see how colour, contrast, texture and material play a key role in overcoming resident anxiety and slips, trips and falls by making spaces easier to navigate.

Fully endorsed and reported by the national news, this 'one-of-a-kind' specification tool takes into account the 12 Dementia Design Principles and allows for true empathy-based design.
